# Download app SD card

Can you download from play store to sd card. How to transfer play store to sd card. Android google play store to sd card. Can i move google play store to sd card. How to move play store to sd card. How to download from play store to sd card.

Are you running out of memory? In this guide, you'll learn how to move apps to your SD card so you can free up storage and get the most from your storage space. Managing storage space has become easier with the help of cloud services, streaming, and smartphones getting more internal memory. Regardless, it's often a matter of time before you find yourself looking around for apps to delete so you can make space for more files and apps. Many of you may own budget devices, which usually make sacrifices in the storage department. You might also enjoy games, and these apps are known to use up a significant amount of storage. The good news is that if your device comes with expandable storage, you'll be able to move apps to an SD card. Additionally, you can turn your microSD card into internal storage. This will effectively make it possible to move apps to your SD card and all other data you may have on your phone. We'll show you how to do both. Read more: The best microSD cards Things to know before moving forward

Edgar Cervantes / Android Authority There are some things to keep in mind before moving forward. While the ability to move apps to an SD card used to be pretty widespread, it's become less common in later years. For starters, the list of devices that even support SD cards is getting shorter. Most of them are mid-range or budget phones. And even if your device has an SD card, it might not support moving apps to an SD card. Furthermore, app developers have to enable this feature. Very few do nowadays. We should also mention that some phones also can turn your external storage into internal storage. This also has its downsides. The main ones are that the phone will require using the SD card at all times, and it can't be transferred to another phone unless formatted. We'll talk more about this method and its consequences in the latter section of this guide. The good news is that it's effortless to move apps to an SD card on Android. Just keep in mind some apps don't allow this feature. Manufacturers might also remove this capability. Open the Settings app. Go into Apps. Access the app you want to move to the SD card. Select Storage. If the app supports the feature, you will see an option called Storage used. To change where the app is stored, tap the Change button right under. Select the SD card. Tap on Move. The phone will transfer the files. This process is reversible, so if you should decide you want the app back on your internal storage, you can move it again using the same process. Related: These are the best external hard drives Use an SD card as internal storage

Edgar Cervantes / Android Authority If the previous method isn't good enough or isn't supported by your app/manufacturer, there's still another way to move apps to microSD on Android. It might be a more convenient option. You can make Android treat your SD card as internal storage. This will make everything much more convenient, as you no longer have to worry about where to put apps and files. Your internal storage and SD card will turn into one conglomerate. Turning your microSD card into internal storage has its downsides. Once you turn an SD card into a phone's internal storage, you will only be able to use that storage unit with that specific phone (unless you format it again). Furthermore, the phone will only work when said microSD card is inserted. Removing it will trigger a factory data reset. Aside from turning your phone and SD card into slaves to each other, you might also have to worry about performance. SD cards can be slow. Make sure you get one that's fast enough to keep performance healthy on your Android device. Lastly, not every phone supports this feature, even if it has expandable storage. Adopt an SD card the easy way Insert the microSD card into the phone. If the device supports it, a notification will ask you how you want to use it. Choose to adopt external storage. This will format and encrypt the microSD card. Put the microSD card in your Android phone. Open the Settings app. Select Storage. Tap on the SD card you inserted. Hit the menu button and select Storage settings. Choose Format as internal. Hit Erase and format. Hit OK. Migrate your data (or choose to do so later). More tips: How to free up storage space on Android Using a third-party app

Joe Hindy / Android Authority If you're having no luck with the native ways to move apps to SD cards, you might want to try one more thing — using a third-party app. There are plenty of them on the Google Play store. A very popular one is AppMgr III, previously known as App 2 SD. Just remember these won't work with all apps either. These apps are great options for when phones have stopped supporting the feature, and your apps still do. Next: Android settings you should change to improve your experience

FAQs Can you move any app to SD? No. The developer has to support this feature. Additionally, the phone has to support this capability and have an SD card slot, which is rare nowadays. Can I remove an SD card if I adopt it as internal storage? Removing an SD card that has been adopted as internal storage will trigger a factory reset. This is because the system has integrated it with the actual internal storage and considers them one. The SD card needs to stay in your phone until formatted again. Technically, you should be able to, but keep in mind that a slower SD card will also slow down your apps. It would be best to consider going for at least a Class 10 UHS-1 SD card. Or one as fast as your phone supports. How commonly do phones support moving apps to SD? It is now a very rare feature. Even older phones that have been upgraded to more recent Android versions have begun to lose these capabilities. Banyak ponsel Android hadir dengan slot kartu SD yang dapat menambah kapasitas memori secara substansial. Dan tidak jarang juga kita menggunakan SD Card sebagai media penyimpanan hasil download game atau aplikasi di google play store. Namun ada satu masalah yang sering dialami oleh beberapa pengguna ponsel Android ketika menampatkan file download dari google play store di kartu SD, yaitu muncul nya error atau game / aplikasi yang di download tidak bisa di buka. Pada artikel ini kami akan memberikan solusi untuk masalah error game yang disimpan di SD Card : Salah satu alasan kenapa game atau aplikasi yang Anda download dari play store mengalami error adalah karena pada sebagian besar game atau aplikasi mengharuskan file system mereka tersimpan di memori internal. Jadi jika Anda menampatkan file game atau aplikasi tersebut di SD card akan memicu terjadinya error, karena system ponsel Anda membaca beberapa file system tidak ada di SD Card. Untuk mengatasi hal tersebut Anda memerlukan bantuan salah satu Aplikasi dibawah ini : 1. Gunakan Aplikasi AppMgr III (App 2 SD) Untuk memindahkan Game atau Aplikasi ke SD Card Download dan simpan game atau aplikasi dari google play store ke memori internal terlebih dahulu. Kemudian uninstall dan download aplikasi dibawah ini. Sistem kerja ini cukup sederhana, game atau aplikasi yang Anda download akan di pindahkan ke SD Card dan secara otomatis sistem ini akan membuat link dari Memori Internal ke SD Card Anda , sehingga file system game akan tetap terbaca oleh sistem ponsel Anda. Cara penggunaan aplikasi ini juga cukup mudah. Anda tinggal download dan install, kemudian pilih game atau aplikasi yang akan Anda pindahkan ke SD Card. Selanjutnya biarkan aplikasi ini bekerja secara otomatis. Untuk alternative, Anda juga bisa menggunakan aplikasi Link2SD. Yang memiliki sistem kerja yang sama dengan aplikasi diatas. Sebetulnya masih banyak aplikasi yang serupa. Namun kami merekomendasikan aplikasi ini karena kami sudah mencobanya terlebih dahulu, barulah kami merekomendasikan kepada Anda. Tinggalkan komentar pada form dibawah ini jika ada kendala atau masalah lain yang ingin Anda tanyakan. Don't you hate it when you try to install a new app on your Android device and the "Not Enough Space" warning pops up? It means all those games, photos, and 4K videos have finally taken their toll. If your phone has a memory card slot, then the solution is easy. A microSD card is a cheap way of expanding your phone's storage. You can move apps to an SD card to free up space, rather than removing apps on your Android device. How you do this depends on what Android version you're using. We'll take a look at all the ways to move Android apps to an SD card in this guide. Using an SD Card on Android: Basics Before you get started, consider a few points. Memory cards are slower than internal storage, so you may notice slightly worse performance for resource-intensive apps. When picking a card, go for the fastest memory card with the largest capacity that your phone can support—check your phone's specifications to see what cards it's compatible with. Also, be sure you know how to spot a fake microSD card to avoid getting scammed. It isn't possible to move preinstalled apps without rooting, and even some third-party apps may not support it. Also, on older versions of Android, you might not be able to use widgets associated with apps you've moved to your memory card. With all this in mind, let's see how to move apps to an SD card. Use an SD Card as Internal Storage

Android Marshmallow introduced changes to the way Android phones can handle memory cards, and these changes have continued into the later versions of Android. You can now set microSD cards to work as internal storage. Instead of having internal and external storage existing as separate spaces, Android views the card as an extension of your built-in space. Data and apps can write to either as needed, and it all happens seamlessly. As a result, you don't need to worry about where your apps are stored. You have to set this up first. Your card will be wiped in the process, so make sure you've backed up any data you need: Insert the card into your phone. When the New SD Card notification appears, tap Set Up. Next, you need to choose how your phone should use the card. Select Phone Storage on Android 9, or Use as Internal Storage on older versions. Alternatively, go to Settings > Storage, select the card, tap the menu button, and select Storage Settings. Tap Format as internal. On the next screen, tap Format SD Card, or Erase & Format. This will wipe your card. On Android 9 and newer, you're offered the chance to move your content—including apps—onto the card. It also shows you how much space you'll save. Hit Move content to complete. This feature is called Adoptable Storage, and it requires you to keep your card in your phone permanently. The card is also encrypted, so you cannot put it in another device to copy the data. The big downside to adoptable storage is that all Android phones are different, so some manufacturers choose not to offer it on their devices. If you don't have it, then you'll have to move your apps to your SD card manually. How to Move Apps to an SD Card on Android 9 Pie and Above You can still transfer apps to an SD card on Android 9 and later manually, even if your phone doesn't support adoptable storage. Just remember that you can't do it for every app, and not at all for pre-installed apps: Go to Settings > Apps & notifications > App info. Find the app you want to move in the list and tap it. Select Storage. If the app supports moving to a card, you'll see a button here labeled Change. Tap this. Select the SD Card in the Change storage dialog box. This brings up a confirmation screen. Tap Move to begin. To move the app back to internal storage, repeat the steps above but select Internal shared storage in the final step. You should always do this when you want to change or remove your memory card. How to Move Apps to an SD Card on Android 8 Oreo The process for moving an app to the SD card on Android 8 is basically the same as for Android 9: Go to Settings > Apps & notifications > App info. Scroll down to find the app you want to move to the card and tap on it. Select Storage. If the app supports being moved to a card, you'll see a section labeled Storage used. Hit the button marked Change. Select the card you want to move the app to, followed by Move. How to Move Apps to an SD Card on Android 7 Nougat You can move apps to a memory card on Android 7 Nougat through Settings. However, you can't move all apps. If they don't support it, you won't see the Change button in Step 3: Go to Settings > Apps. Locate the app you want to move to your microSD card and tap on it. Go to Storage > Change and choose your card from the prompt box that opens. Tap Move to complete the process. Depending on the size of the app, it may take a few moments to complete (especially in the case of large games), so don't touch your phone until it's done. To move the app back, repeat the steps and choose Internal shared storage in Step 3. How to Move Apps to an SD Card on Android 6 Marshmallow Moving apps to a microSD card is the same on Marshmallow as it is on Nougat: Go to Settings > Apps, then tap on your chosen app. Tap Storage > Change, then choose the card when prompted. Hit Move to complete the process. How to Move Apps to an SD Card on Android 5 Lollipop Lollipop has less robust support for memory cards than later versions of Android, but you can still move apps from within Settings. You're limited in which apps you can place on your external storage; it depends on the developer supporting the option. Also, the entire app doesn't move across to the card either—only part of it does. You can see which apps you've got on your card by swiping to the right tab in the App screen, labeled On SD Card. This makes it easy to identify any that you may wish to move back in the future. To move apps: Go to Settings > Apps and tap the app you want to move to your SD card. Next, under the Storage section, tap Move to SD Card. The button will be grayed out while the app moves, so don't interfere until it's done. If there's no Move to SD Card option, the app cannot be moved. Once it's done, the Storage section will update to show how much of the app is now stored on the card (and how much is still in internal storage). The Move button will now read Move to Phone or Move to Device Storage. Tapping on this allows you to remove the app from the card. How to Move Apps to an SD Card on Android 4.x and Earlier Support for microSD cards was extremely limited in all Android 4.x versions (including KitKat, Jelly Bean, and Ice Cream Sandwich). Stock Android didn't support the ability to move apps to an external card at all, as Google seemed intent on phasing cards out entirely. However, some manufacturers did opt to include the feature in their own versions of the operating system. If your older device supports it, the process is straightforward: Go to Settings > Apps. Next, locate and tap the app you want to move to the card. Select Move to SD card. If this button isn't available, you can't move the app (or your phone doesn't support doing so). In the unlikely event that you're still using an Android 2.x device, these steps are roughly the same ones you'll encounter. Home screen widgets are not supported in these old versions—you'll need to keep an app on internal storage if you want to use a widget. If you don't have the option on your phone, then you'll need to look into a third-party app. If your phone doesn't support moving apps to the SD card, or if you want to move an app that doesn't support it individually, there are a few old third-party apps that can help you out. Apps2SD is a popular option, as is FolderMount. Both require a rooted Android phone. We're going to look at another choice, Link2SD, which has both root and non-root features. You can use it to move apps to your card in bulk, to "force-move" apps that don't normally allow it, and to offload data folders for larger apps and games to your external storage. First, launch the app and grant root permissions if your phone is rooted. Then tap the app you want to move and select an option: Link to SD Card: This requires root and moves the entire app and its data to your card. Move to SD Card: This doesn't require root and only works if your phone supports moving apps to external storage. If you do have root, you can also force-move apps that don't otherwise support it. Link to SD Card (Data and Cache): Moves data files, and requires root. To move more than one app at a time, tap the menu button in the top right corner and choose Multi-select. Now tap all the apps you want to move, hit the menu button again, and choose either Link to SD card or Move to SD card. These are the same options as described above. Link2SD is free, with a paid upgrade. It hasn't been updated for some time, but still works on Android 2.3 and up. Download: Link2SD (Free) | Link2SD Plus (\$2) How to Move Apps to an SD Card on Android The best way to transfer apps to your SD card depends on what version of Android you're using, whether your phone's manufacturer has implemented all the features, and what app you want to move. In summary: On phones that support adoptable storage, that's the best choice. It removes any need to manage your card manually. For phones that only support moving apps to the card manually, that method is the best and cleanest. If your phone doesn't support any of this, or if you have specific requirements, consider rooting and using Link2SD. Don't overlook the occasional disadvantages of using an SD card on Android. If your apps are taking up too much space, another good solution is to use Lite versions of popular apps. Not only are they smaller and take up less space, but they run faster on older or less powerful phones too.
